

## COVID-19:

# HOW DOES IT SPREAD?

THE VIRUS IS THOUGHT TO SPREAD THROUGH RESPIRATORY DROPLETS.

Respiratory droplets may be produced through a cough, a sneeze, normal breath or conversation.

Respiratory droplets may cause viral transmission from person to person when near one another.

It may be possible for an individual to contract COVID-19 by first touching a surface or object that has the virus on it and then touching their own mouth, nose or possibly their eyes.

These droplets may also land on clothing or other objects.

Droplets may transfer from working in close proximity of each other.
